

# The effect of land consumption on municipal tax revenue: Evidence from Bavaria

Artem Korzhenevych, Sebastian Langer

Leibniz Institute of Ecological Urban and Regional Development,  
Dresden, Germany

# Background (1)

- In the year 2000, the growth of settlement and traffic area in Germany reached 129 hectares per day
- German national sustainability strategy: goal of limiting built-up area and transport infrastructure expansion to **30 hectares per day** by 2020
- Similar policies also in Austria, Switzerland, EU as a whole (aim of zero net consumption of land by 2050)
- The aim is to slow down the conversion of undeveloped land and to preserve open areas (biodiversity protection, etc.)
- In 2012-2017, however, daily land consumption for settlement and traffic purposes in Germany still amounted to about 66 hectares (94 soccer fields)

## Background (2)

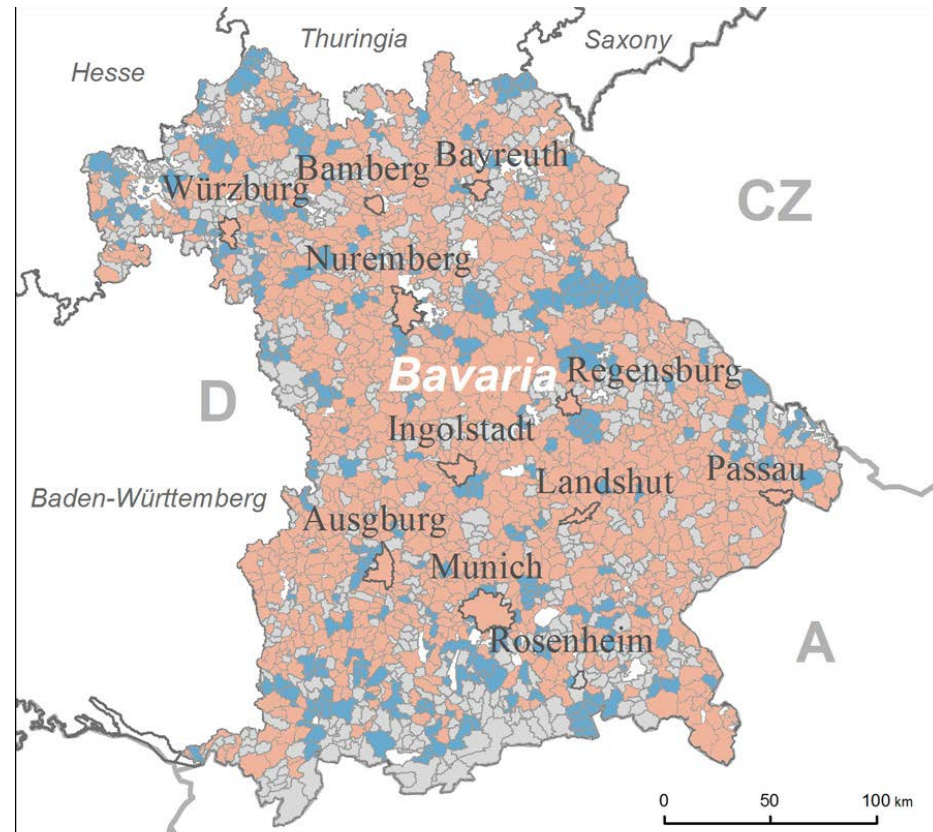

- Competition for tax revenues, jobs, and residents between municipalities
- Conversion of open area as an instrument for attracting new firms and residents and thus, tax revenues (Leviathan theory)
- Local authorities in Germany have a high degree of autonomy in developing and allocating land
- But: Mönnich (2005) and Sbosny and Siebert (2010) speak of “ruinous competition” in this context, that leaves many municipalities with losses rather than profits
- **Research gap: estimate the link between land consumption and tax revenues for a large sample of municipalities**
- Focus on industrial and commercial land use and business taxes

# This paper

- Estimates the effect of built-up industrial and commercial (BIC) area changes on business-tax revenues in cross-sectional instrumental variables estimations
- Shows differences between more and less densely populated municipalities
- Draws conclusions on achieving land saving by means of tradable planning permits (TPP)

# Study area

- Federal state of Bavaria in Germany
- Largest federal state (12.44 million inhabitants)
- 2056 politically independent municipalities
- Business tax accounts for about 1/3 of all municipal revenues

**Change in total built-up industrial and commercial area 2009-2013 (in ha)**

Leibniz Institute of  
Ecological Urban and  
Regional Development

Data: VG250 © GeoBasis-DE/ BKG 2013  
Statistics: State Statistical Office of Bavaria

# Data

- Business tax revenue (Gewerbesteuer)
  - Genesis database for Bavaria
  - Tax rate (multiplier) differs across municipalities
- Built-up industrial and commercial area
  - IOER Monitor, based on ATKIS Basic DLM
  - Not reported yearly
  - We calculate the difference between 2013 and 2009
- Other control variables at municipal level: Genesis database
  - Tax multiplier, population, density, total sales, debt level p.c., unemployed p.c., share of employees in manufacturing

# Identification

- OLS regression:

$$\Delta TR_i = \beta_0 + \beta_1 \Delta BIC\_area_i + \sum \gamma_i \Delta X_i + \epsilon_i$$

- Potential endogeneity between built-up area and business tax revenue!
- We use open-space area in 1995 as an instrument for BIC area change between 2009 and 2013
- Open space includes agricultural areas and most of urban open space (parks, urban gardens, recreational areas etc)
- Two-stage least squares estimation with an IV

# Main results

	(1)	(2)	(3)	(4)	(5)
	OLS	OLS	IV	IV	IV
<b>Built-up industrial and commercial area change</b>	20.81*** (7.56)	<b>12.73**</b> <b>(5.49)</b>	20.52*** (7.84)	16.9*** (4.97)	<b>12.85***</b> <b>(3.57)</b>

# Urban-rural differentials (IV)

	(1)	(2)	(4)	(5)	(6)	(7)	(8)
Interaction dummy (municipality belongs to certain density quantile or type)	Top 75 %	Top 50 %	Top 25 %	Top 10 %	Top 5%	Partially or mostly urban (BBSR)	Mostly urban (BBSR)
BIC area change	7.01*** (3.82)	6.16** (2.8)	6.69** (2.63)	7.27*** (2.24)	6.83*** (2.18)	5.01** (2.48)	7.14*** (2.43)
BIC area change x Interaction dummy	7.25*** (3.44)	13.18*** (3.9)	22.16*** (6.32)	42.62*** (10.97)	53.29*** (13.28)	19.71*** (5.07)	34.61*** (9.02)
Control variables	YES	YES	YES	YES	YES	YES	YES
N	1383	1383	1383	1383	1383	1383	1383
R <sup>2</sup>	0.40	0.42	0.45	0.56	0.62	0.44	0.49
First-stage diagnostic: Kleibergen-Paap F-statistic	45.59	49.08	51.66	47.67	50.94	39.88	50.93

\* p<0.1, \*\* p<0.05, \*\*\* p<0.01. Robust standard errors in parentheses.

- Revenue effect substantially higher effects in urban areas
- Low revenue effect in the periphery

# Robustness checks (IV)

	(1)	(2)	(3)	(4)	(5)	(6)
	2009-2012	2010-2013	5-year lag of the tax multiplier	Only positive tax revenue changes	Extreme residuals excluded	Cities with county status excluded
<b>BIC area change</b>	21.09*** (5.58)	10.29** (4.03)	12.54*** (3.56)	14.42*** (4.32)	7.16*** (1.70)	<b>6.84***</b> <b>(1.69)</b>
<b>Wald test (p-value)</b> <b>H<sub>0</sub>= coefficient not signif. different from 12.85 (key estimate)</b>	0.1403	0.5263	0.9326	0.7157	0.0008	0.0004
<b>Control variables</b>	YES	YES	YES	YES	YES	YES
<b>N</b>	1472	1339	1383	1044	1373	1363
<b>F</b>	2.33	2.44	2.71	2.78	8.22	3.22
<b>R<sup>2</sup></b>	0.28	0.53	0.39	0.49	0.32	0.09

\* p<0.1, \*\* p<0.05, \*\*\* p<0.01. Robust standard errors in parentheses.

- The effect seems to be driven by the most densely populated cities

# Discussion

- Cautious comparison with the costs of land development (initial costs of 15-35 €/m<sup>2</sup>, yearly maintenance costs of 3-4 €/m<sup>2</sup>) suggests that the investigated built-up areas in Bavaria may be profitable, no “ruinous competition”
- Still, in other regions, the balance could be different
- Large differences in the tax effects of BIC area change among municipalities: background for tradable planning permits -> incentivize reduction of land consumption in the periphery
- Implementation of TPPs in Germany not yet foreseen
- More detailed analysis needed: land development data, account for property tax changes, changes in transfer payments

# Questions and comments are welcome
